BUILDING WITH NATURE

**to develop / realise / operate / maintain
water-related infrastructure**

while

- (1) making good use of the forces of nature**
- (2) embedding the structure in nature /
nature in the structure**
- (3) creating new opportunities for nature**

market perspective

A photograph of a large crowd of people at a conference or event, with many individuals looking towards the camera or slightly away. The image has a grid-like texture. Overlaid on the center is a diagram with a green-to-gray gradient background. The diagram consists of two upward-pointing arrows. The top arrow is light green and contains the text 'high-wage'. The bottom arrow is light gray and contains the text 'low-wage'. Above the top arrow is the text 'high-tech, high added value' and below the bottom arrow is the text 'low-tech, low added value'.

high-tech, high added value

high-wage

low-wage

low-tech, low added value

high-tech

traditional
competitive
domain

high added value

pre-competitive
innovation
domain

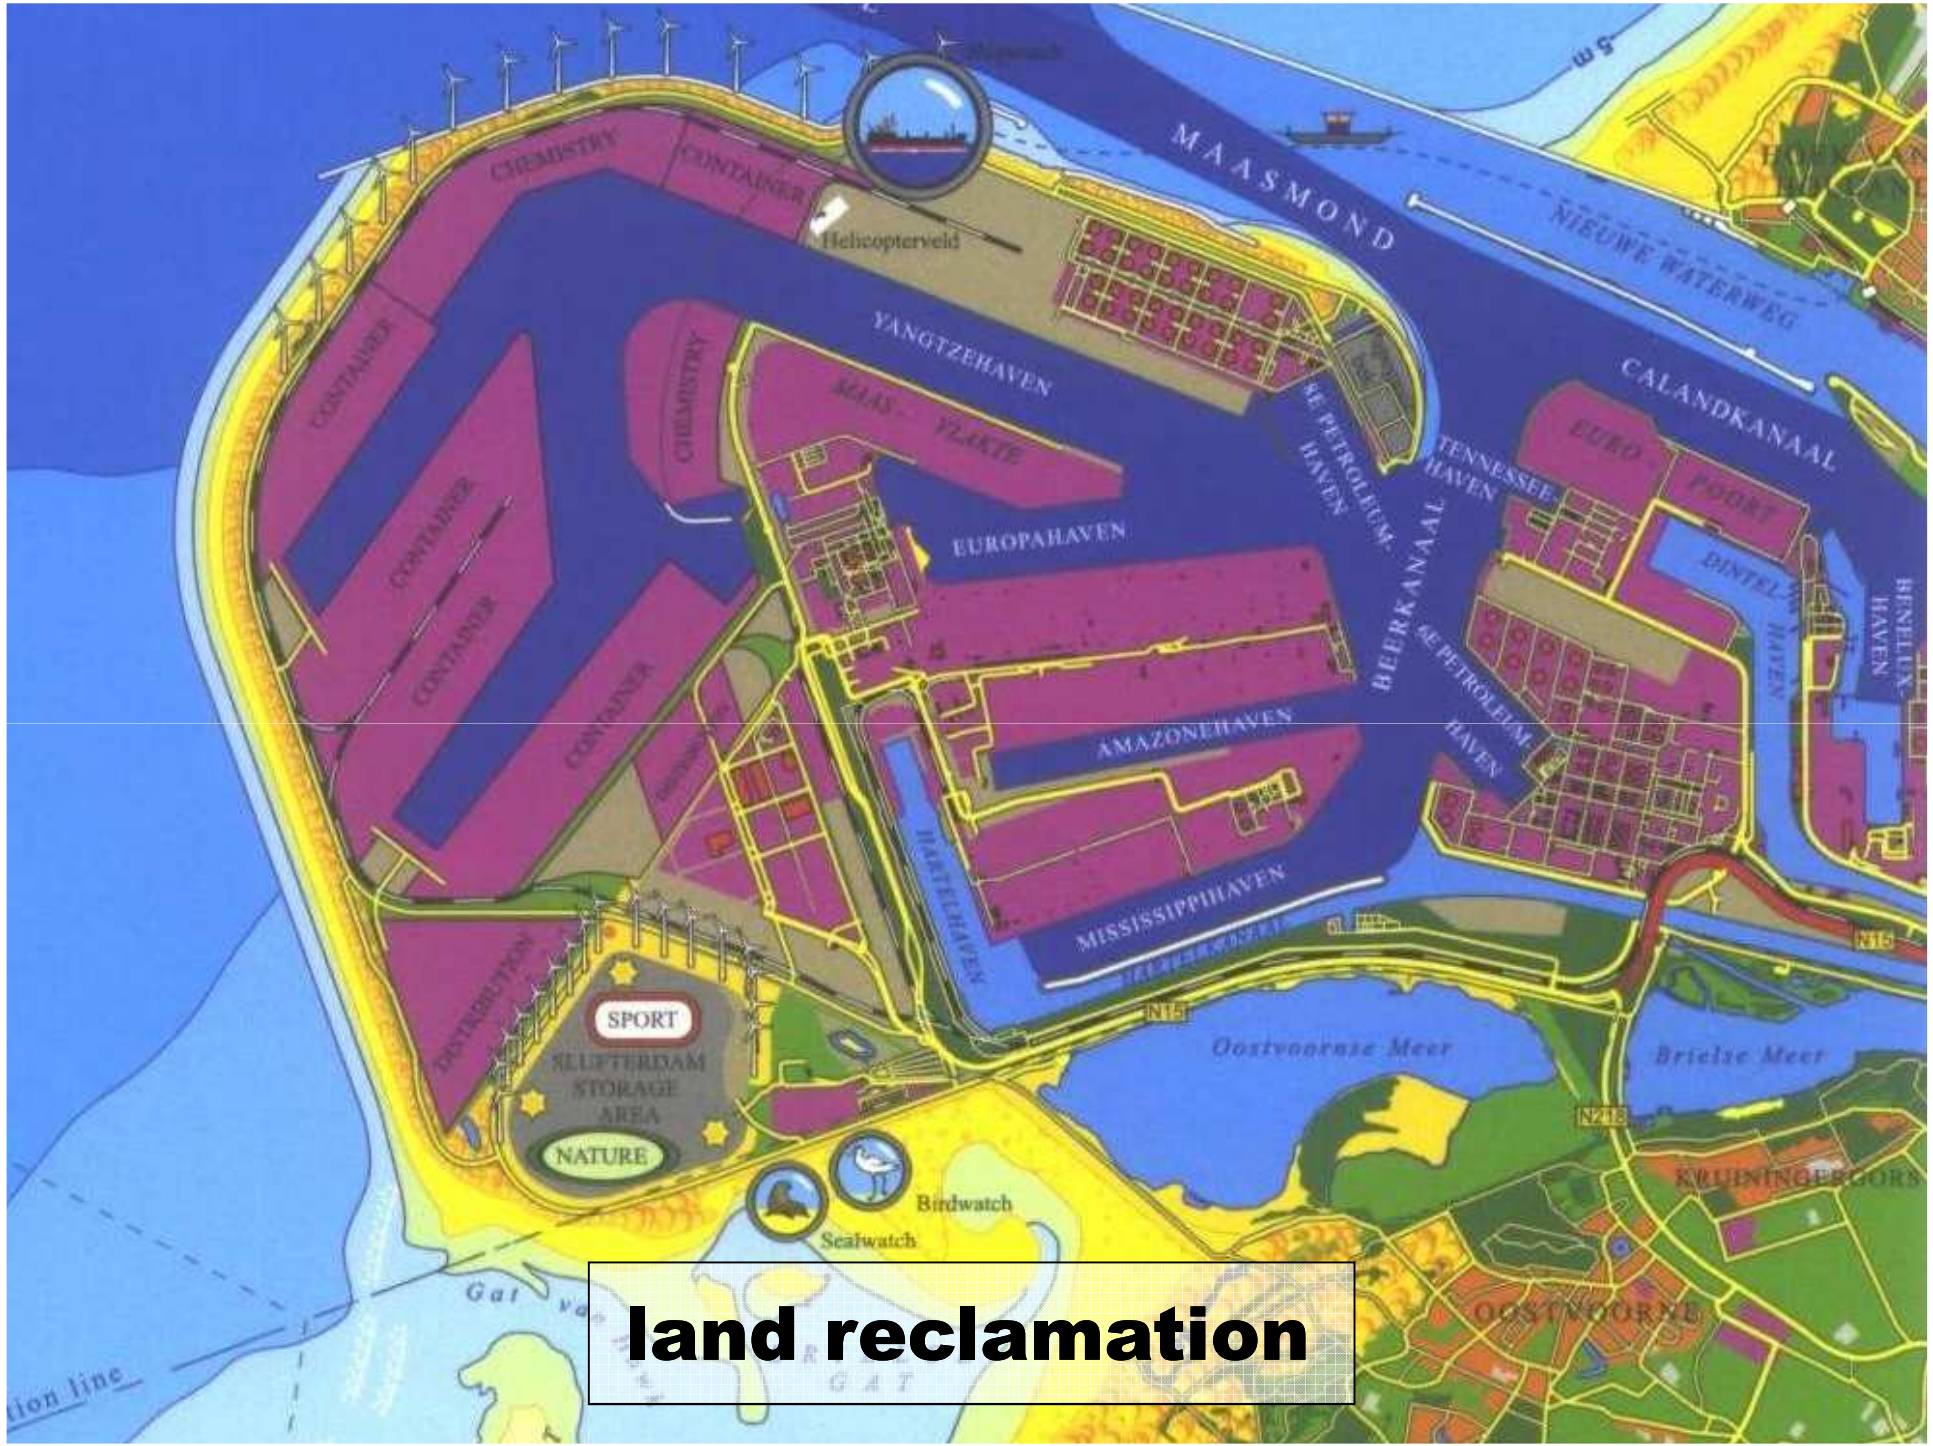

GREENTECH

market

⇒ **opportunities**

land reclamation

flood and inundation protection

shore maintenance

shore maintenance

Taco

sand mining

traffic and transportation

water resources management

habitat restoration

EcoShape

HIGH ADDED VALUE
where to be gained?

CLIENT'S PROBLEMS

- **complex legislation**
- **lengthy procedures**
- **environmental impact**
- **unrealistic environmental norms**
- **assertive stakeholders**
- **pressure on space**
- **cost/benefit arguments**

ENVIRONMENTAL LEGISLATION

- conservation-oriented

- ⇒ red list (species to be conserved)
- ⇒ room for autonomous change?

+ loss of habitat may be compensated

- ⇒ disproportionate requirements?

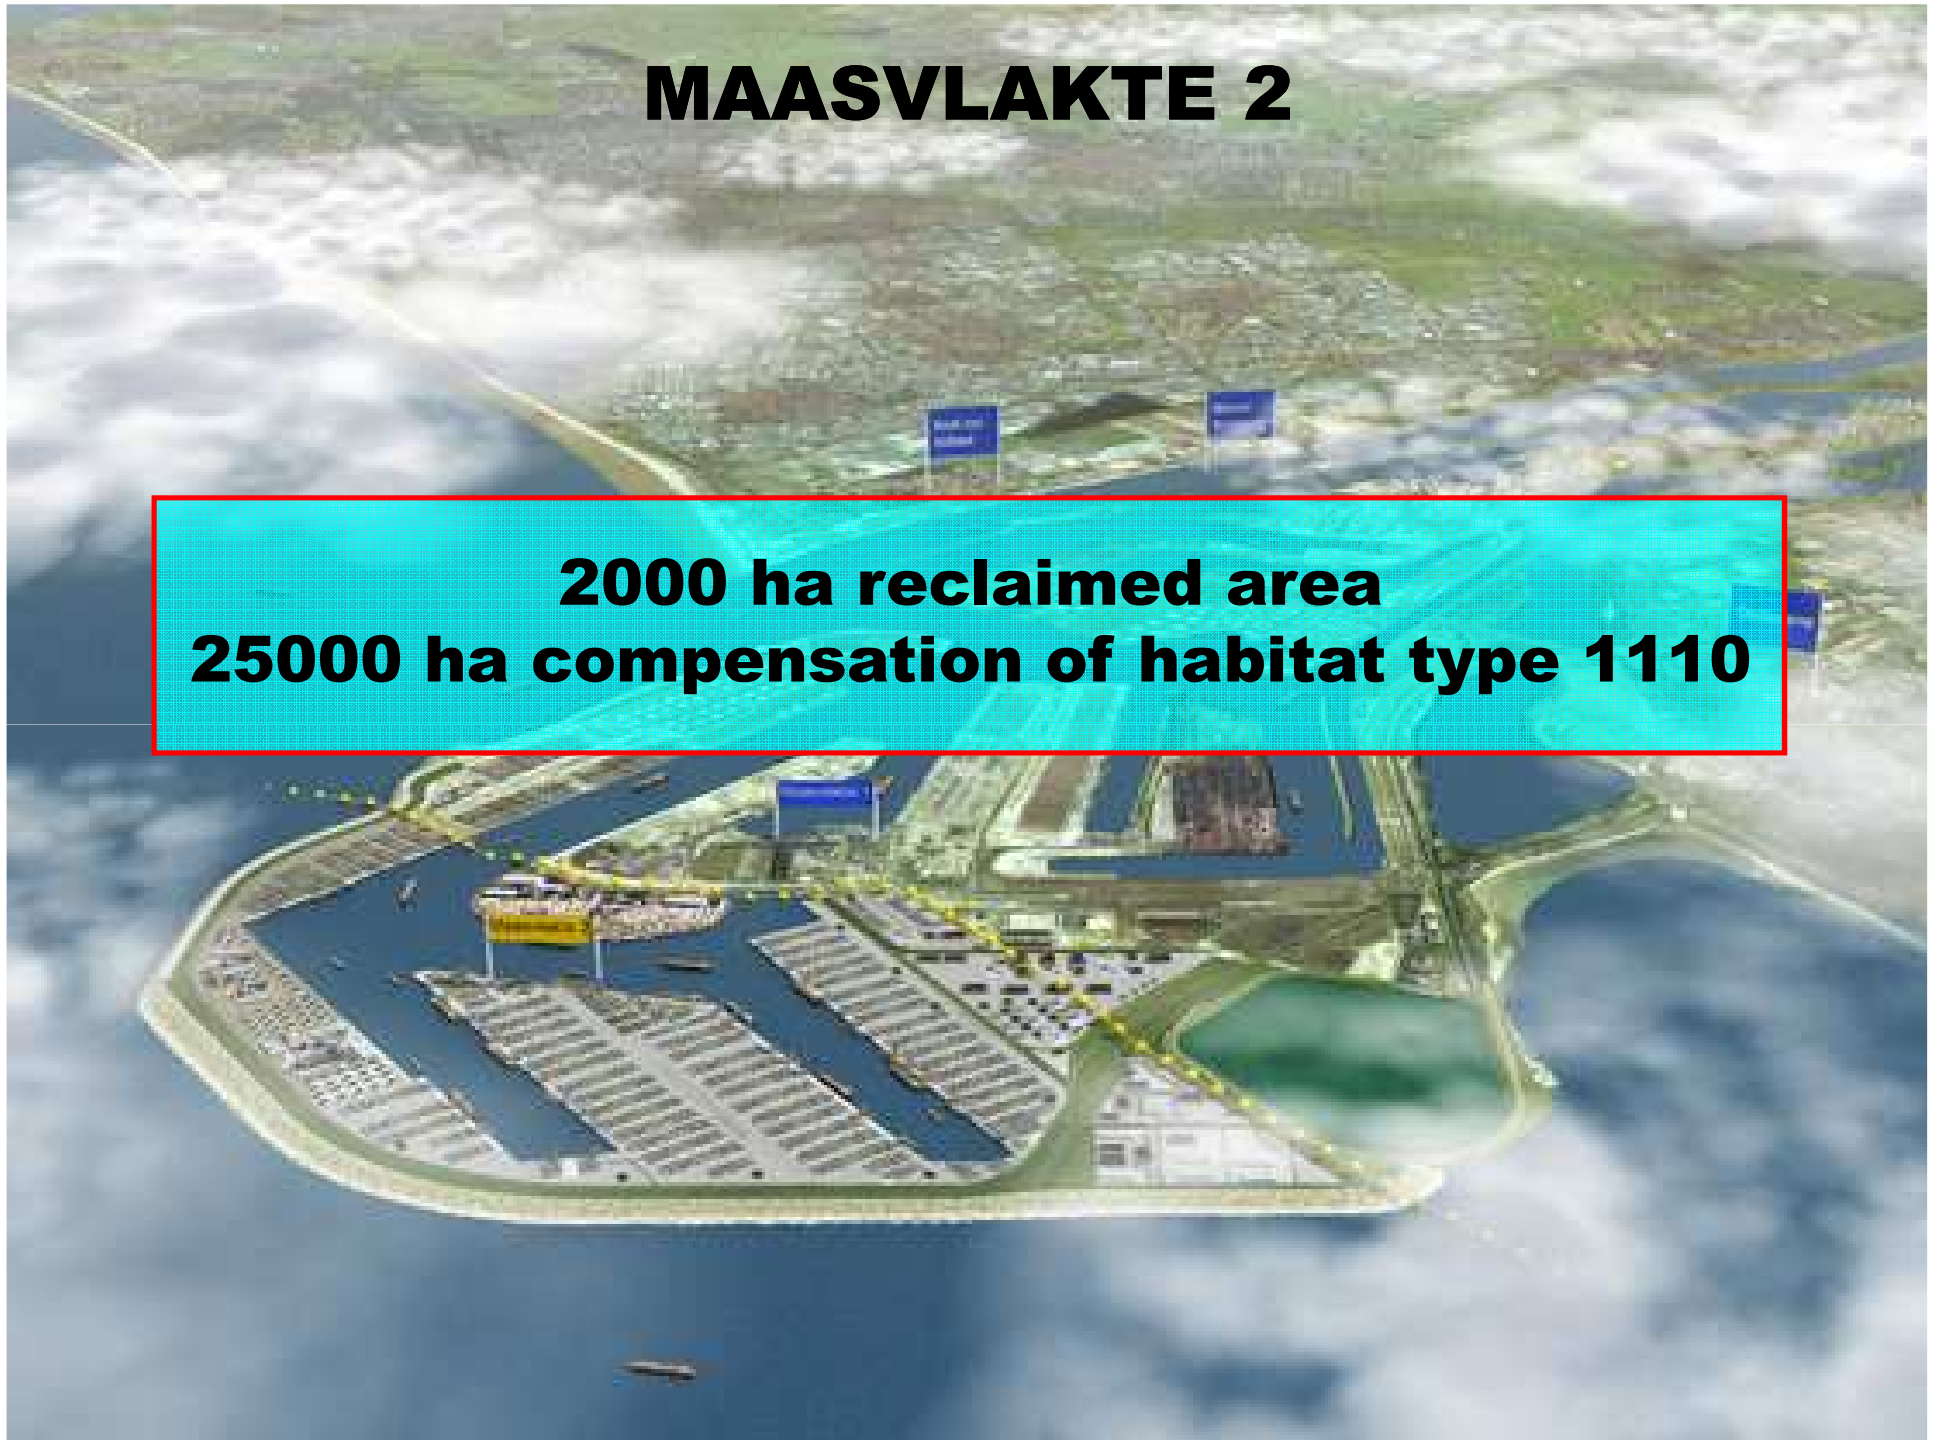

- rigid interpretation by local government

- ⇒ severe derived regulations
- ⇒ rigid permit policy
- ⇒ strict enforcement

BUT: difficult to change, long procedure
⇒ **try to live with it / make use of it**

MAASVLAKTE 2

2000 ha reclaimed area
25000 ha compensation of habitat type 1110

ENVIRONMENTAL NORMS

e.g.:
how much turbidity
during how long a time
can the ecosystem take?

don't just copy the
Øresund,
know your system
and
derive specific norms

PROCEDURES & STAKEHOLDERS

- **excessive number of permits required**
 - ⇒ high preparation costs
 - ⇒ susceptible to bureaucracy
- **stakeholders**
(well-organised, well-advised, well-informed)
 - ⇒ able to obstruct and delay
 - ⇒ make clever use of legislation
(e.g. precautionary principle)

(1) know how the natural system functions and responds to human interventions

(2) involve key stakeholders from the early development stages onwards

**how will MV2 affect
mud and larvae transport
to the Wadden Sea?**

**State Council:
'insufficiently
investigated'**

**2 extra years
of study ?
⇒ cannot be
assessed**

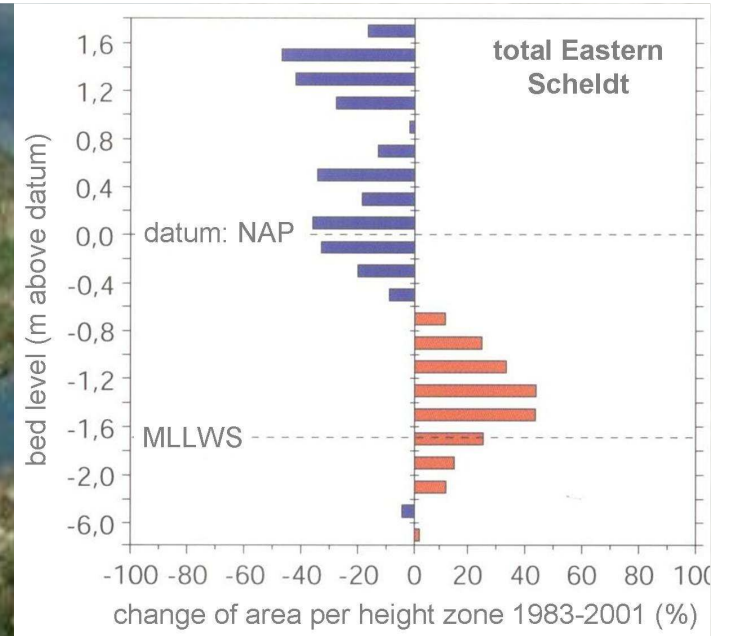

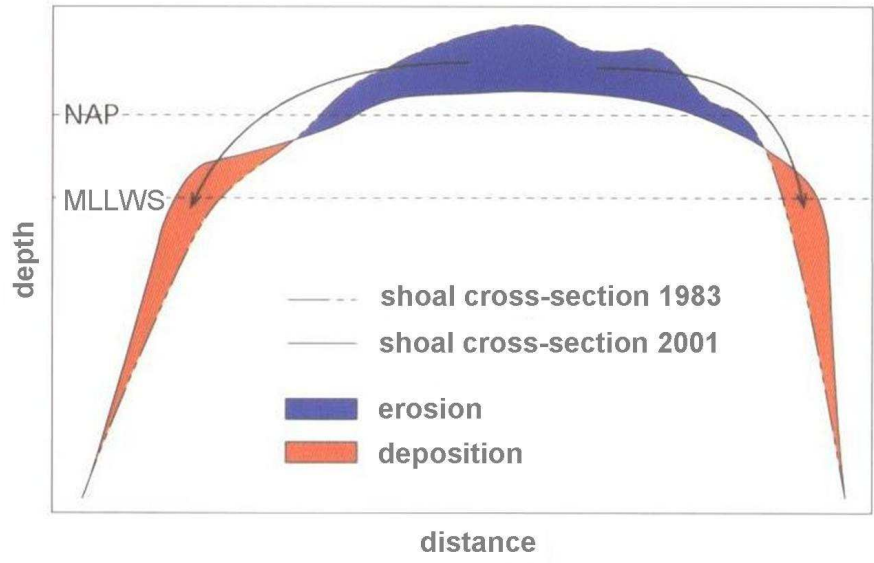

ENVIRONMENTAL IMPACT

- **foreseeable impacts**
 - ⇒ how to prevent or mitigate?
 - ⇒ how to speed up recovery?
- **unrealistically predicted impacts**
 - ⇒ how to avoid or expose?
- **unforeseen impacts**
 - ⇒ how to undo or mitigate?

**(1) know the system you're working in
& make use of it**

(2) embed your structure in nature

(3) embed nature in your structure

COSTS AND BENEFITS

- **economical cost-benefit analysis**
⇒ **focused on economic profit**
- **societal cost-benefit analysis**
⇒ **focused on people's welfare and well-being**
- **environmental cost-benefit analysis**
⇒ **People, Profit, Planet in balance**

- (1) evaluate bwn-projects with ECBA**
- (2) money as common denominator?**
- (3) ecosystem services broad enough to determine environmental value?**

**ECONOMICALLY
NOT FEASIBLE**

CONCLUSION

building with nature:

- has good market perspectives
- can provide for a high added value
- can create win-win situations

if:

- we know the (eco)system we work in
- we can point out the value we create
- we share our knowledge with stakeholders
- we get involved in early decision making
